UNIVERSITY OF VICTORIA EXAMINATIONS APRIL 1999

C SC 230 Computer Architecture and Assembly Language

NAME (print):	REG NO.
SIGNATURE:	DURATION: 3 hours
INSTRUCTOR: D. M. Miller	
TO BE ANSWERED ON THIS EXAMINATION PAPER	
STUDENTS MUST COUNT THE NUMBER OF PAGES PAPER REFORE REGINNING TO WRITE, AND REPO	

THIS EXAMINATION HAS **TEN** PAGES PLUS THIS COVER PAGE.

IMMEDIATELY TO THE INVIGILATOR.

ATTEMPT EVERY QUESTION. ANSWER IN THE SPACES PROVIDED (YOU DO NOT NECESSARILY HAVE TO USE ALL LINES PROVIDED AND MAY USE OTHER AREAS ON THE **FRONTS** OF THE PAGES IF NECESSARY). USE THE BACKS OF THE PAGES FOR ROUGH WORK.

THIS IS AN OPEN BOOK EXAMINATION. YOU MAY REFER TO THE TEXT MICROPROCESSORS AND MICROCOMPUTERS: HARDWARE AND SOFTWARE (FOURTH EDITION) OR ANY OTHER SINGLE TEXT, AND THE ASSEMBLER AND SIMULATOR GUIDES. NO OTHER AIDS, E.G. COURSE NOTES OR CALCULATORS, ARE PERMITTED.

QUESTION	MAX. MARK	STUDENT'S MARK

5. (13 marks)

Consider the following program:

;The sum of the elements of the array "arr" is placed in the location ;labelled "total".

```
$8000
         org
         fcb
                121,124,169,85,38
arr
total
         rmb
                2
                $9000
         org
         lds
                #$01FF
         ldx
                #arr
         ldy
                #5
         jsr
                sum
         std
                total
         stop
```

;Subroutine sum receives the number of elements to be totaled in register Y ;and the array address in register X. It leaves the result in register D.

```
ldd
                #0
sum
                #0
loop
         сру
         beq
                end
         addb
                0,x
         adca
                #0
         inx
         dey
         bra
                loop
end
         rts
```

- (a) What is the content of accumulator A on exit from subroutine "sum"?
- (b) What is the content of index register X on exit from subroutine "sum"?
- (c) The above program passes its parameters, both input and output, via registers. You are to modify it to pass the parameters via the stack. There are to be three parameters which in order are: (1) the address of the array of values; (2) the number of values to be totaled; (3) the address of the location where the result is to be placed. Parameter (1) is to be on top. You are to make the additions necessary to the main program and the subroutine.

You are also to add any instructions necessary to ensure all accumulator and index registers used by the subroutine are protected.

6. (12 marks)

A push-button is connected as an input to IC3. You are to write a subroutine that **polls** IC3 until the button has been pressed (a rising edge on IC3). Once the rising edge occurs, your subroutine is to light a LED at Port A bit 5 for 1 second. After the one second, your subroutine turns off the LED and returns. Your subroutine should protect the accumulator and index registers it uses. Use OC3 for timing the one second. Use **polling** for OC3. Assume a 2MHz processor clock and recall there are 1000 milliseconds in a second. Use the usual control register names such as TFLG1, TOC2 etc. without defining them.

Show any initialization needed outside the subroutine in the space provided.

nitial	lization out	tside sub	routine:

7. (16 marks)

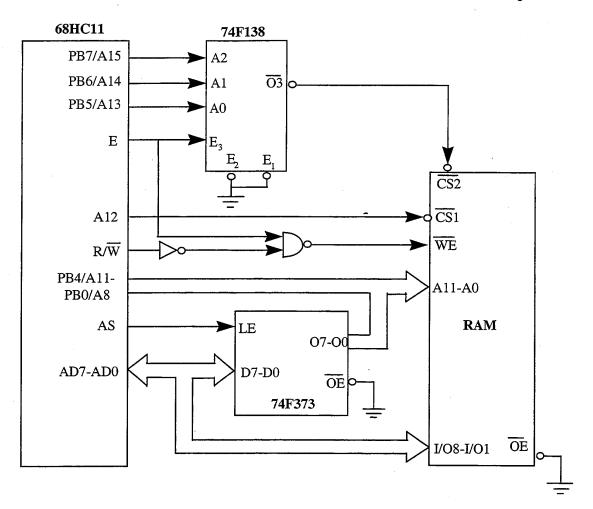

Complete the following stop watch program so it behaves as described. Note it is not the same as the one you did for assignment 5. The routines ZERO and NDISPLAY are not shown for brevity. You do **not** have to write them. Assume the processor has a 2MHz clock.

```
; This is a stop watch program that times in 1/10's of a second.
; The watch is in one of three states:
      state 0 stopped with the time at 0 (initial state)
      state 1 running
      state 2 stopped with the time held at the time it was stopped
; The watch starts in state 0. A rising edge on IC3 takes the watch
; to the next state in order 0 -> 1 -> 2 -> 0 etc. So the first IC3
; event starts the watch. A second one stops it, and a third one
; resets it to 0.
; OC2 interrupts are used for timing.

8.	•	marks) What is the purpose of the start bit in asynchronous serial communication?
	(b)	What is the purpose of the parity bit in asynchronous serial communication?
	(c)	Draw the bit pattern that would be sent for the ASCII character X (\$58) assuming 7 bits, even parity with one stop bit. Draw vertical lines to separate the bits.
9.	(a)	narks) What is the advantage of having separate fixed-point and floating point processors in a CPU?
	(b)	Briefly explain how the compiler assists branch prediction on the Power-PC.
10.		narks) nsider the diagram on the next page (it is not identical to the one shown in class):
	(a)	How many bytes of memory does the RAM chip have?
		What range of addresses does the RAM chip occupy?
		Which component(s) would not be needed if the 68HC11 had separate address and data busses?
		(continued on next page)

11. (2)	What does the term superscalar mean with respect to processor design?					
		·····
